Prendete nota, nello spazio apposito, dei dati relativi al modello e al rivenditore del vostro SuperCyc 2.4: in caso di richiesta di informazioni, pezzi di ricambio, servizi di riparazione o altro ci permetteranno di assistervi con la massima rapidità e precisione.

Please note in the space provided above the relative service information of the model and the retailer from whom you purchased your SuperCyc 2.4: This information will assist us in providing spare parts, repairs or in answering any technical enquiries with the utmost speed and accuracy.

ATTENZIONE: la sicurezza dell'apparecchio è garantita solo con l'uso appropriato delle presenti istruzioni, pertanto è necessario conservarle.

WARNING: the security of the fixture is granted only if these instructions are strictly followed; therefore it is absolutely necessary to keep this manual.

Congratulations on having purchased a **coemar** product. You have assured yourself of a fixture of the highest quality, both in componentry and in the technology used. We renew our invitation to you to complete the service information on the previous page, to expedite any request for service information or spares (in case of problems encountered either during, or subsequent to, installation). This information will assist in providing prompt and accurate advice from your **coemar** service centre.

1. Packaging

Following the instructions and procedures outlined in this manual will ensure the maximum efficiency of this product for years to come.

Open the packaging and ensure that no part of the equipment has suffered damage in transit. In case of damage to the equipment, contact your carrier immediately by telephone or fax, following this with formal notification in writing.

packing list

Ensure the packaging contains:

1 SuperCyc 2.4

1 **instruction manual**

2. Transportation

The SuperCyc 2.4 should be transported in its original packaging or in a **coemar** approved flight case.

We recommend the use of a suitable flight case which will stop the articulated movement of the SuperCyc 2.4 during transportation.

Two inbuilt mechanical stops may be utilised to block the articulated pan and tilt movement.

1) The first stop, located between the base and the yoke, stops the pan movement (base).

To stop the pan movement of the yoke, position the stop as shown in the following diagram.

Press in on the stop and rotate it to the point where you can insert it into the matching hole on the base of the unit.

2) The second stop, located between the yoke and lamp housing, inhibits tilt movement of the fixture.

To stop the tilt movement of the head, position the stop as shown in the following diagram.

Rotate the stop to the point where you can insert it into the matching hole on the body of the unit.

Press the stop into the hole and then rotate it 180° to fasten it.

3. Importanti informazioni di sicurezza

Fire prevention:

1. SuperCyc 2.4 utilises 2 Philips MSR 1200 or MSD 1200 lamps. The use of any other lamps is not recommended and will null and void the fixture's warranty.
2. Never locate the fixture on any flammable surface.
3. The minimum distance from flammable materials: 0,5 m.
4. The minimum distance from the closest illuminable surface: 2 m..
5. Replace any blown or damaged fuses only with those of identical values. Refer to the schematic diagram if there is any doubt.
6. Connect the projector to main power via a thermal magnetic circuit breaker.

Prevention of electric shock:

1. High voltage is present in the internals of the unit. Isolate the projector from mains supply prior to performing any function which involves touching the internals of the unit, including lamp replacement.
2. For mains connection, adhere strictly to the guidelines outlined in section 7 of this manual.
3. The level of technology inherent in the SuperCyc 2.4 requires the use of specialised personnel for all service applications; refer all work to your authorised **coemar** service centre.
4. A good earth connection is essential for proper functioning of the projector. Never operate the unit without proper earth connection..
5. The fixture should never be located in an exposed position, or in areas of extreme humidity. A steady supply of circulating air is essential.

Protection against ultraviolet radiation:

1. Never turn on the lamp if any of the lenses, filters, or the housing is damaged; their respective functions will only operate efficiently if they are in perfect working order.
2. Never look directly into the lamps when it is operating.

Safety:

1. The projector should always be installed with bolts, clamps, and other fixings which are suitably rated to support the weight of the unit.
 2. Always use a secondary safety chain of a suitable rating to sustain the weight of the unit in case of the failure of the primary fixing point.
 3. The external surfaces of the unit at various points may exceed 150°C. Never handle the unit until at least 10 minutes have elapsed since the lamp was turned off.
 4. Always replace the lamp if any physical damage is evident.
 5. Never install the fixture in an enclosed area lacking sufficient air flow; the ambient temperature should not exceed 35°C.
 6. A hot lamp may explode. Always wait for at least 10 minutes to elapse after the unit has been turned off prior to attempting to replace the lamp.
- Always wear suitable hand protection when handling lamps.

4. Lamp: Installation and replacement

SuperCyc 2.4 utilises 2 Philips 1200 MSR or MSD 1200 lamps rated at 1200W with GX 9,5 bases.
The lamp is available from your authorised **coemar** sales agent:

1200 MSR		1200 MSD	
coemar cod.	105090	coemar cod.	105811
power	1200 w	power	1200 w
luminous flux	110.000 lm	luminous flux	92.000 lm
colour temperature	5.600° K	colour temperature	6.000° K
lamp base	G 22	lamp base	G 22
approximate life	800 hours	approximate life	2000 hours

Attention

Disconnect mains prior to opening up the unit

The fixture's internal temperature can reach 250° C after 5 minutes with a maximum peak of 350° C; ensure that the lamps are cold prior to attempting removal. The fixture should be allowed to stand and cool for 10 minutes prior to its removal. MSR and MSD are part of the mercury vapour family of discharge lamps and must be handled with great care. The lamps operate at high pressure, and the slight risk of explosion exists if operated over their recommended lamp life. We recommend, therefore, that the lamp be replaced within the manufacturer's specified lamp life.

installing the lamps

- 1) Using an appropriate screwdriver, remove the 6 screws which hold the rear cover of the projector body housing in place.

- 2) Open the rear housing using the handle provided.

- 3) Locate the two lamp assemblies, left and right, and with an appropriate screwdriver, remove the 3 screws which affix the lamp assembly in place.

English

4) Remove the lamp assemblies.

5) Locate the lamp holder.

6) Insert the lamps. The lamps are manufactured from quartz glass and should be handled with care; always adhere to the instructions supplied in the lamp's packaging. Never touch the glass directly, use the tissue provided in the lamp's packaging. The G 22 lampbase is symmetrical. DO NOT USE UNDUE FORCE. In case of difficulty, inspect for physical damage and then repeat the installation procedure.

7) Replace the lamp assembly in its original position and refasten the 3 screws previously removed.

8) The procedure outlined above should be repeated for both lamps.

Attention: DO NOT replace the rear housing until the replacement lamps have been aligned in the optical path of the projector so as to avoid any accidental overheating of the internal components of the fixture. This procedure is described in section 13 of this manual.

5. Operating voltage and frequency

The projector may operate at 208, 230 or 240 V. **coemar** presets (barring specific requests), an operating voltage of 240V. The operating voltage and frequency of the projector is noted on the base of the unit. SuperCyc 2.4 may be operated at either 50 or 60 Hz and requires no alterations for it to do so.

selecting an operating voltage other than that specified on order

In order to alter the operating voltage of the projector, simply alter the setting of the switch located on the base of the unit. The switch will allow you to select 1 of 2 voltages indicated on the sticker placed there prior to delivery.

**Selettore in
posizione 240 V**

main setting

☒208V

☐230V ☒240V

**Selettore in
posizione 208 V**

main setting

☒208V

☐230V ☒240V

Set the switch to the required voltage.

If you wish to alter the voltage to other than those indicated on the sticker, contact your local **coemar** service centre. This procedure should be carried out only by qualified personnel.

6. Installing the unit

mounting

SuperCyc 2.4 may be either floor or ceiling mounted.

For floor mounting purposes, the SuperCyc 2.4 is provided with four feet on the base of the unit.

If suspending the fixture, the structure from which the unit is hung should be of sufficient rating to hold the weight of the unit, as should any clamps used to hang the unit. The structure should also be sufficiently rigid so as to not move or shake whilst the SuperCyc 2.4 moves during its operation. struttura di supporto priva di torsione.

The 2 mounting holes Ø13 mm (A) on the base of the SuperCyc 2.4 allow the projector to have hook clamps fitted for the purpose of hanging.

safety chains

The use of a safety chain (cod. 069) - fixed to the SuperCyc 2.4 and to the primary suspension structure is highly recommended to protect against the accidental failure, however unlikely, of the primary suspension point. If using an after-market safety chain not manufactured by **coemar**, ensure that it is of a sufficient rating to hold the weight of the unit. The safety chain is attached by means of the two holes B located in the base of the unit as shown in the diagram.

protection against liquids

The projector contains electric and electronic components that must not come into contact with water, oil, or any liquid.

movimento movement

The projector has articulated movement in the base and through its yoke; **DO NOT** obstruct the articulated movement in any way.

risk of fire

Each fixture produces heat and must be installed in a well-ventilated position. The minimum recommended distance from flammable material is: 0.5m. Minimum distance from the object being illuminated is: 2m.

7. Mains connection

cable preparation

The mains cable provided is thermally resistant, complying to the most recent international standards.

NB: In case of cable replacement, similar cable with comparable thermal resistant qualities must be used exclusively (cable 3x1,5 Ø external 8 mm, rated 300/500V, tested to 2KV, operating temperature -40° +180° **coemar** cod. CV5309).

mains connection

SuperCyc 2.4 can operate at voltages from 208V-230V-240V at 50 or 60Hz (operating voltage and frequency can be selected as described in section 5 of this manual). Prior to connecting the unit to your mains supply, ensure that the model in your possession correctly matches the mains supply available to you.

For connection purposes, ensure your plug is of a suitable rating: **16** amps. Locate the mains cable which exits the base of the unit and connect as shown below:

protection

The use of a thermal magnetic circuit breaker is recommended for each SuperCyc 2.4.

A good earth connection is essential for the correct operation of the fixture. Strict adherence to regulatory norms is strongly recommended.

NOTE

SuperCyc 2.4 must be provided with a good earth connection; never install the unit without the green/yellow cable being properly connected.

8. Signal connection

Control signal is digital and is transmitted via two pair screened $\varnothing 0,5$ cable.

Signal type is DMX 512, conforming to international standard; connection is via either the XLR 3 or XLR 5 plugs and sockets.

Pin connection conforms to international standards:

pin 1= screening 0 volts

pin 2= data -

pin 3= data +

pin 4= not connected

pin 5= not connected

8.1. Signal connection using XLR 5 plugs/sockets

8.2. Signal connection using XLR 3 plugs/sockets

Ensure that all data conductors are isolated from one another and the metal housing of the connector.

Note: the housings of the cannon XLR 3 or XLR 5 must be isolated.

9. Pan and tilt movement lock

Two mechanical stops are used to lock the articulated pan and tilt movement when the projector is off. Prior to turning on the projector, you must unlock the stops, allowing the projector to perform its reset procedure, which is automatically performed each time the projector is powered up.

- 1) The first stop is located between the base and the yoke, inhibiting the pan movement of the projector. Locate the stop and gently rotate it until it automatically releases itself

- 2) The second stop, located between the yoke and the lamp housing, inhibits the tilt movement of the lamp housing. Locate the stop and gently rotate it until it automatically releases itself

10. Powering up

After having followed the preceding steps, turn on the DMX 512 controller which will be used to control the SuperCyc 2.4; following this, turn on the power to the unit and turn on the unit's **main breaker** switch. The projector will perform a reset function on all the internal and external motors. This will last some few seconds, after which it will be subject to the external signal from the controller.

DMX led

The display will be static on to indicate that DMX 512 signal is being correctly received.

If the display flashes, the projector is not receiving signal. Check your cabling and the controller for correct functioning.

11. DMX addressing

Each SuperCyc 2.4 utilises **11 canali** channels of **DMX 512** signal for complete control.

To ensure that each projector accesses the correct signal, it is necessary to correctly address each fixture. Any number between 1 and 500 can be generated via the multifunction panel of the SuperCyc 2.4.

This procedure must be carried out on every SuperCyc 2.4 being used.

When initially powered up, each projector will show **A001** indicating **DMX** address **1**; a projector thus addressed will respond to channels **1** to **11** from the **DMX 512** controller; a second unit should be addressed as **12**, a third as **23** and so on until the final SuperCyc 2.4, has been addressed.

altering the dmx setting

- 1) Press the + or – buttons until the desired DMX address is displayed. The display will flash to indicate the selected address is not stored in memory

address **±** **enter** **11 channels per unit**
A001 to A500

- 2) Press the enter button to confirm your selection; the display will stop flashing and the projector will now respond to the new DMX 512 setting.
- 3) To better understand the function of each channel, we refer you to section 13 "DMX 512 channel functions".

Important Note: Keeping the + or – buttons pressed will cause the display to alter at increased speed, allowing a faster selection to be effected.

12. Display panel functions

The display panel on the base of the SuperCyc 2.4 is used to display and set function information and various parameters and can enhance the operation of the projector to suit your particular application.

Altering the coemar factory settings may vary the functioning of the projector, causing to not respond to external DMX 512 signal. Please read and familiarise yourself with the following information very carefully before altering any selections.

NOTE: the  symbol is used throughout the following table to indicate the action of pressing the particular button referred to in the accompanying text.

A001  menu	+0-  D IRP pan movement inversion To reverse horizontal movement direction of the beam from left to right and vice versa on DMX level variation.	enter  +0- 	CW  clockwise	enter 
		+0- 	CCW  counter-clockwise	enter 
	+0-  DIRT tilt movement inversion To reverse vertical movement direction of the beam from the bottom upwards and vice versa, on DMX level variation.	enter  +0- 	CW  clockwise	enter 
		+0- 	CCW  counter-clockwise	enter 
	+0-  OPTO optic sensors deactivation To deactivate optic sensors that sense the position of the yoke and the base of the unit and that allow the return in position of the unit if accidentally knocked out of place.	enter  +0- 	ON  sensors activation	enter 
		+0- 	OFF  sensors deactivation	enter 
	+0-  FANS fans control Fans function controlled through PCB (Strd) Fans always on (on).	enter  +0- 	STRD  automatic on/off	enter 
		+0- 	ON  fans always on	enter 
	+0-  LAMS lamps switching control To deactivate the two lamps switching on/off control through DMX signal.	enter  +0- 	STRD  ignition by DMX 512	enter 
		+0- 	ON  lamps always on	enter 
	+0-  LAMP switching on control To independently deactivate the switching on/off control of lamps through DMX control	+0-  LEFT  left lamp	STRD  ignition by DMX 512	enter 
		+0- 	ON  lamps always on	enter 
		+0-  RIGHT  right lamp	STRD  ignition by DMX 512	enter 
		+0- 	ON  lamps always on	enter 
	+0-  HOUR working time (lamp on) Visualisation of unit's working time (lamp on) (reset operation not possible)	+0-  LEFT  left lamp	0320  numeric value shown in hours	
		+0-  RIGHT  right lamp	0323  numeric value shown in hours	
	+0-  LIFE lamp life Visualisation of lamp life (time covered by mains supply from last reset operation)	+0-  LEFT  left lamp	0280  numeric value shown in hours	
		+0-  RIGHT  right lamp	0275  numeric value shown in hours	
	+0-  DISP reverse display Reverse reading display depending on mounting position (ground mounted or suspended)	enter 	AA  suspended position	enter 
		enter 	VV  reverse	enter 
	+0-  LED display control To disable display visualisation.	enter 	OFF  switching off display ( any key to re-activate it)

		enter 	ALL  motors test	enter 
	+0-  RESE reset Reset function	enter 	---  reset activation	
	+0-  RATE DMX speed DMX signal reception speed	enter 	24.S0  reset activation	
	+0-  HTOT total working time Total visualisation of unit's working time (time covered by mains supply) (reset operation not possible)	+0- 	0520  numeric value shown in hours	

English

12.1. Turning on the SuperCyc 2.4 without articulated movement

This function may be useful should you need to turn on the SuperCyc 2.4 whilst it is still in its flight case or located in cramped conditions in order to alter its dmx address setting or adjust some other parameter.

- 1) Turn on the projector whilst simultaneously holding down the **menu**, **enter** and **-** buttons.

The projector will undertake a reset of all motors except those which govern pan and tilt movement.

- 2) You may alter the dmx address or any other parameter at this point without any movement occurring.
- 3) To reactivate the normal functioning of the SuperCyc 2.4, you need simply to turn the projector off and then on again via its **power** button, or simply perform a reset.

12.2. Resetting the electronic lamp life counter

The electronic lamp life counter should be reset to zero at every lamp change in order to provide accurate lamp life information.

- 1) Turn off the projector.
- 2) Power up the SuperCyc 2.4 whilst simultaneously holding down the **+** and **-** buttons.

- 3) Press the **menu** button.
- 4) Press the **+** or **-** buttons until **LIFE** (for lamp life) is displayed.
- 5) Press the **enter** button; the display will show **0000** confirming that a reset of the counter has occurred.

12.3. test

This function generates a test signal for each motor so that they can be tested in the absence of any external DMX source.

- 1) This function generates a test signal for each motor so that they can be tested in the absence of any external DMX source.
- 1) Press the **menu** button.
- 2) Press the **+** or **-** buttons until **TEST** (for test) is displayed.
- 3) Press the **enter** button to confirm your selection; the display will show **PAN** (for testing the pan movement), press the **+** or **-** subsequent tests, from **PAN** to **ALL**.

PAN= movement in the X axis

TILT= movement in the Y axis

DIMM= dimmer movement

CYAN= cyan

MAGE= magenta

YELL= yellow

ALL= test all motors

NOFU= no effect

During the test procedure, the projector will simulate receiving DMX 512 signal ranging from 1 to 255 on the selected channel.

- 4) Press the **enter** button to confirm execution of the selected test.

13. DMX 512 channel functions

SuperCyc 2.4 may be controlled via DMX 512 signal, connection being as described in section "8. Signal connection".

If all the procedures have been carried out correctly to this point, your DMX 512 controller will have control over all the functions of the SuperCyc 2.4 as shown in the table below:

channel	function	type of control	effect	decimal
1	Base (pan) coarse	proportional	coarse control of the base movement	0-255
2	Base (pan) fine	proportional	fine control of the base movement	0-255
3	Yoke (tilt) coarse	proportional	coarse control of the Yoke movement	0-255
4	Yoke (tilt) fine	proportional	fine control of the Yoke movement	0-255
5	movement speed	proportional	from fast to slow	0-255
6	dimmer	step	closed	0-10
		proportional	from close to open	11-255
7	cyan	step	white, no effect	0-10
		proportional	proportional cyan control from white to cyan	11-255
8	magenta	step	white, no effect	0-10
		proportional	proportional magenta control from white to magenta	11-255
9	Yellow	step	white, no effect	0-10
		proportional	proportional yellow control from white to yellow	11-255
10	Lamp right on/off	step	lamp off	0-100
			lamp on	241-255
11	Lamp left on/off, all lamps on/ reset	step	lamp off	0-10
			Park (idle, no function)	11-29
			lamphouse motor reset (only once)	30-100
			motor reset (only once)	101-170
			2 lamps on (override ch 10)	171-249
			lamp on	250-255
Back panel can inhibit lamp off function				
note 1: 2 numbers close to the end limit levels cannot be used as unstable levels				
note 2: lamp ON/off/reset functions has a delay time of 6 second to prevent accidental activation.				
note 3 :on/off lamp mode is not affected unless an opposite value is received				

Note that to turn on the 2 lamps individually channels number 10 and 11 should be brought up to between 250 and 255. Alternatively, you may turn on both lamps simultaneously by bringing channel 11 up to between 171 and 249.

The lamps in the SuperCyc 2.4 may also be switched on utilising the display panel located in the base of the unit, as described in section "14 Display panel functions".

14. Aligning the lamps in the optical system

Alignment is achieved by manipulating the 3 adjusters which support the lamp assembly.

Alignment is necessary to compensate for the slight variations in the mechanical construction of respective lamps due to the fact that many discharge lamps are still partly constructed manually.

The procedure should be undertaken to properly align the lamps in the optical system, thus avoiding the possible overheating of internal components due to incorrect focusing of the beam onto components which are not designed to be exposed to this.

Alignment procedure

Alignment is effected by manipulating the 3 adjusters, **A**, **B** and **C** simultaneously; with the lamp on and blackout shutter dimmer and no filters placed in the optical path.

The procedure should be undertaken on one lamp at a time to avoid interference amongst them.

A beam from a lamp which is not aligned will result in a noticeable hotspot, the result of the position of the lamp with respect to the reflector. Using the three adjusters centres any hotspots and then flattens the beam to produce an even beamsread.

The three adjusters move the lamp horizontally, vertically and axially within respect to the reflector.

15. Mechanical adjustments

After having powered up the projector and set up either DMX 512 or automated control of the functions of the SuperCyc 2.4, you may wish to perform the following mechanical adjustments to optimise the output of the unit in your installation.

15.1 Alternating beam angles by inserting diffusion filters

Variations of the beamspread, thereby offering greater flexibility in output, are able to be produced by the unit, by utilising a range of diffusion filters available from your coemar distribution network.

Prior to undertaking the following procedure, ensure that the dimmer is closed to avoid eye exposure to the beam.

Attention

Never look directly into the light beam.

- 1) Use a suitable screwdriver to remove the screws which hold in place the diffusion filter.

- 2) Remove the current diffusion filter.

- 3) Insert a new filter suitable to your requirements.
- 4) Replace to two fasteners, ensuring they are secured firmly.

Further adjustments to the output of the fixture may be made by adjusting the barndoor, as described below.

15.2 Barndoor adjustments

The SuperCyc 2.4 features a 4 leaf barndoor which can be used to alter the beamspread to suit your particular application.

- 1) Adjust the angle of each leaf to suit your installation.

- 2) After adjusting your leaf position, ensure that the fastening screws are securely tightened to avoid sagging.

16. Automated internal functions

SuperCyc 2.4, has several automatic functions and features which at first glance may not be noticed. However, they serve to add functionality to the projector, and to assist in extending the serviceability of the unit.

on-board hot-strike timer

This on-board feature ensures that the operator cannot re-ignite the lamp until 6 minutes have passed since the lamp was switched off.

This is designed to avoid damage to the lamp ignition circuit which can occur if an operator continually attempts to strike a hot lamp. It further protects the lamp from possible damage due to voltage spikes which may occur at this time.

NOTE: The timer is reset only when the projector is switched off.

on-board lamp ignition timer

This feature ensures that an operator cannot repeatedly attempt to strike a lamp for more than 3 seconds if the lamp does not ignite. It will automatically attempt to restrike the lamp for 3 seconds in every subsequent minute.

This is designed to protect the ballast and lamp ignitor from prolonged usage in less than ideal conditions.

NOTE: it is important to replace a lamp that is at the end of its useful life and replace it. Old lamps are generally progressively more difficult to strike.

thermal protection

*Two thermal sensors in the body and base of the *SuperCyc 2.4* protect the unit against overheating.*

The thermal sensors operate by removing voltage to the lamp if the ambient temperature rises above a preset maximum due to either less than ideal air circulation around the fixture or in the event of cooling fan failure.

automatic realignment

*An internal 4 point encoder system allows the *SuperCyc 2.4* to return to its correct position in case the unit is accidentally knocked out of alignment whilst operating. This is particularly useful if the projector is to be mounted on the floor in a position where the performer or artist may accidentally bump the unit.*

NOTE: this facility may be deactivated if desired (see section 11 opto).

17. Maintenance

Whilst every possible precaution has been taken to ensure the trouble-free operation of your SuperCyc 2.4, the following periodic maintenance is highly recommended. Make sure that mains power is disconnected prior to performing any maintenance.

Attention

Disconnect mains power prior to opening the inspection lid

Periodic cleaning lenses and reflectors

Even a fine layer of dust can reduce the luminous output substantially. Regularly clean all lenses and the reflector using a soft cotton cloth, dampened with a specialist lens cleaning solution. To do this, remove the two screws at the sides of the safety glass. Remove the glass and use the lens cleaning solution and a soft cotton cloth to clean the reflectors.

Periodic maintenance Lamps

The lamps should be replaced if there is any observable damage or deformation due to heat. This will avoid the danger of the lamps exploding; you may gain access to the lamps as described in section 4.

Open the rear panel of the unit using the handle placed there for this purpose.

Fans and air passages

The fans and air inlets must be cleaned regularly to ensure the unit operates correctly. This should be undertaken at least every 6 weeks, the period for this periodic cleaning will depend, of course, upon the conditions in which the projector is operating. Suitable instruments for performing this type of maintenance are a brush and a common vacuum cleaner or an air compressor.

The fans and air inlets must be cleaned regularly to ensure the unit operates correctly. This should be undertaken at least every 4 weeks, the period for this periodic cleaning will depend, of course, upon the conditions in which the projector is operating.

To gain access to the fans, remove the 4 screws located at the rear of the unit. Suitable instruments for performing this type of maintenance are a brush and a common vacuum cleaner or an air compressor. Should this not suffice, the filter itself may be immersed in a cleaning detergent.

Mechanicals

Periodically check all mechanical devices for wear and tear; gears, guides, belts, etc., replacing them if necessary. Ensure the screws affixing the barndoors are firmly tightened.

Electrical components

Check all electrical components for correct earthing and proper attachment of all connectors, refastening if necessary.

Dichroic filters

To correctly clean and maintain the dichroic filters, it is necessary to gain access to the internals of the projector. This should be done only by qualified technical personnel.

fuse replacement

Locate the fuse, which protects the lamp and electronics, in the base of the unit.

Using a multimeter, test the condition of the fuse, replacing it with one of equivalent type if necessary.

18. Electronic motor alignment

RESERVED FOR INSTALLERS ONLY

The display panel on the SuperCyc 2.4 allows for the electronic calibration of the unit's motors; this procedure is undertaken by **coemar** at predelivery; it may be useful to perform this procedure in the case of internal components being replaced.

Altering the factory settings may radically alter the functioning of the projector. Carefully read all of the following prior to attempting any changes.

electronic calibration

Important Note: electronic calibration is only possible if the projector is connected to a **DMX 512** source.

Important Note: At the termination of the above electronic calibration procedure, if the **END** function is not performed, no memory changes will be effected. This allows the operator to abort any changes made, in case of operator error.

Note: Simultaneously pressing the **+** and **-** buttons will cause the calibration value to return to 128 (default).
