# **LiPI's RADIAS Librarian**

## **What is LiPI's RADIAS Librarian ?**

My librarian:

- can handle more then 256 program at once (the maximum is depending on your computer's ability);
- can short the programs by name or category or programmer or comment;
- can multiple edit the category, programmer and comment fields;
- can export as individual programs (as RADIAS editor's rdp file) or RADIAS editor's bank file (rdl); they are fully compatible, loadable etc. by RADIAS editor
- can get actual program and it's parameters from RADIAS edit buffer;
- can randomize RADIAS program parameters by nine plus one (All) groups; It's very useful for sounddesign ;-) (The Waldorf blofeld's factory presets are mostly random generated and then tweaked programs as you know by blofeld's manual...)
- can import/convert KORG R3 (r3l), MS2000 and microkorg (syx) files both individual patches and banks with a few restrictions;

The librarian is written in JAVA. The librarian's file format (rlb) is in fact nothing else but RADIAS editor's rdp file in one file ;-) If you hand on hex editing the files, you can cut out any program from the rlb file, save as with rdp extension and you can use it immediately in RADIAS editor.

My librarian can't enough accurate in MS2000, microKORG and R3 file importing and converting.

- the librarian can't handle the Vocoder programs (I'm not interested in that scene);
- the R3 DWGS are not same as RADIAS PCM table! So you need some tweaking after importing R3 programs if it's use R3 DWGS in OSC1;
- the MS2000 and microKORG programs delay settings are not accurately converting yet now (2017. february);

With all above I think it's a very useful tool for your RADIAS if you have more than favourite programs than 256 what are fit in your RADIAS memory.

# LiPI's RADIAS Librarian

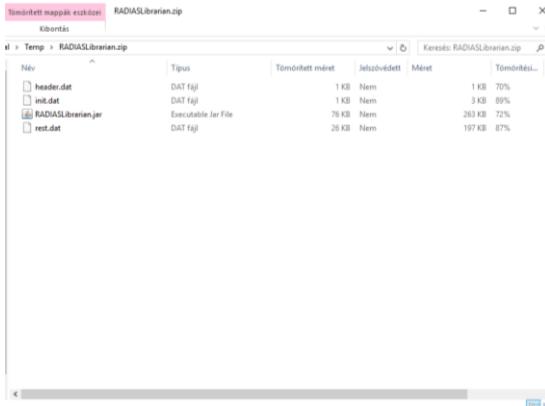

## How to setting up?

You have to got Java SE Runtime Environment 7 or later version on your computer! It's the running environment of the librarian! If you don't have, you can download from the official site: <http://www.oracle.com/technetwork/java/javase/overview/index.html>

---

You can download a Radiaslibrarian.zip file from my website: <http://lipi.atw.hu>.

After you downloaded the Radiaslibrarian.zip file you have to extract the all files from it to a directory for example to the C:/Program files(x86)/KORG/Librarian. There is four files like this:

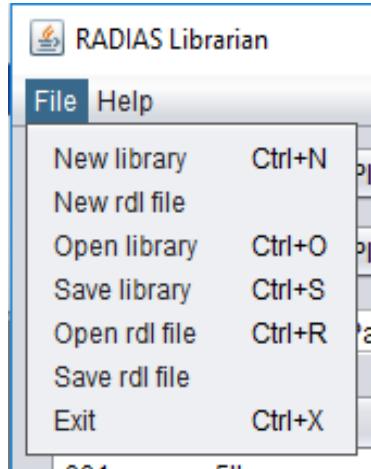

You can make a shortcut to your desktop by a right click on the RADIASLibrarian.jar file. It's the librarian itself, the other 3 files are data files for the rdl export feature. When you double click on the shortcut or on the Radiaslibrarian.jar file your computer will start the JAVA runtime environment, load the Radiaslibrarian and run it.

# LiPI's RADIAS Librarian

## How to use?

### The File menu

The New library create a new empty library int he memory if the last library is in saved state.

The New rdl file will load 256 Init program into the „import” table.

The Open library will open a library file and load programs into the library table.

The Save library will save the library table contents into a rlb file.

The Open rdl file open a RADIAS editor's rdl file and load the programs into the „import” table.

The Save rdl file will save the „import” table contents into a RADIAS editor's rdl file.

The Exit will close the application.

# LiPI's RADIAS Librarian

## MIDI

The screenshot shows the LiPI's RADIAS Librarian software window. It has a menu bar with File and Help. On the left, there are dropdown menus for RADIAS MIDI OUT Port (Please select) and RADIAS MIDI In Port (Please select), both with checkboxes for Enable. Buttons for Import rdl file, Import u/MS2K, Import R3, and Clear Table are also present. On the right, there are checkboxes for Noise level always 0, OSC's, Filters, AMP, LFO's, and PTCH, along with buttons for RND ALL:, VOICE, EG1, EG2, EG3, and RES.P. The Library is set to AllinOne.rlb and Programs: 2035. An Open rlb button is available.

The librarian has three main modules. The left one is the „from“ side and on the top of the MIDI „setup“.

## **LiPI's RADIAS Librarian**

In order to communicate the librarian with your RADIAS you have to set the used MIDI ports. The „RADIAS MIDI OUT PORT” mean: int that port will RADIAS send the messages to the librarian (program dump, etc.). The „RADIAS MIDI IN PORT” mean int hat port use to send messages from librarian to the RADIAS. Usually the RADIAS OUT PORT is the „RADIAS SOUND”, the RADIS IN PORT is the „RADIAS KBD” if you use USB cable between the RADIAS and your computer. When the librarian is start, it's listing the available MIDI ports to itself and fill the drop down menus. The changes in MIDI ports meanwhile the librarian is running does not effected int he drop down list!

The enable checkboxes are provide convenient features. If you have need the RADIAS MIDI port in another application in another session, you can check out the box and you make free the RADIAS MIDI PORT. After the other session the free port can booking again from the RADIAS by the checkbox – you don't have to use the drop down list again...

# LiPI's RADIAS Librarian

## The „from” side; the import table

On the left side is the import table and the import/open buttons under the MIDI settings.

The screenshot shows the LiPI's RADIAS Librarian application window. On the left, there is an import table with columns: Prg.No., Name, Category, Programmer, and Comment. The table lists 28 entries from 001 to 028, all categorized as Arp/Seq and programmed by KORG Inc. with comments like "Factory preset Timbre". Above the table are two dropdown menus for MIDI ports: "RADIAS MIDI OUT Port" and "RADIAS MIDI In Port", both set to "Please select". Below these are buttons for "Enable", "Open rdl file", "Import u/MS2K", "Import R3", "Clear Table", and "Import selected ->". To the right of the table are several checkboxes: "Noise level always 0" (checked), "OSC's", "Filters", "AMP", "LFO's", "PTCH.", "RND ALL :)", "VOICE", "EG1", "EG2", "EG3", and "RES.P.". Below these are buttons for "Import all -->", "Exclude same name" (checked), "RADIAS CurrentDump ->", "set this text to ...", "selected programmer ->", "selected comment ->", "Bass" (selected from a dropdown menu), "set this category to selected ->", "<- selected to a program", "Export selected to a rdl file", and "Write selected as individual rdp files". At the bottom right is a library table with columns: p.No., Name, Category, Programmer, and Comment. It lists 28 entries from 1998 to 2026, mostly categorized as Synth Soft or MS2K Preset, programmed by R3 or MS2K Preset. A URL "www.axim.de/r3dias" is visible at the bottom right of the library table.

# LiPI's RADIAS Librarian

The import field contain the last loaded file name.

## The „Open rdl file” button:

By that you can load into the import table a RADIAS editor rdl file what is contain a bank of 256 RADIAS programs. You will got a file browser -> use it ☺

## The „Open rlb file” button:

By that you can load into the import table a librraian rlb file what is contain any instances of RADIAS programs. You will got a file browser -> use it ☺

## The „Import u/MS2K” button:

By that you can import into the import table microkORG or MS2000(B) programs by syx files. The librarian automatically sense how many programs are int he syx files. The import method has some restrictions (see page 4.)! You will got a file browser -> use it ☺

## The „Import R3” button

By that you can import into the import table a KORG R3 r3l file. The import method has some restrictions (see page 4.)! You will got a file browser -> use it ☺

## The „Clear table” button:

You can clear the „import” table by that button... Tha programs from the table and the computers memory are deleting...

You can select one program int he „import” table by mouse click. In this case the program parameters are send to the RADIAS edit buffer if your MIDI settings are correct and enabled.

If you do multiple selection by CTRL+mouse click or SHIFT+mouse click program parameter does not send to the RADIAS, because the librarian doesn't know which one have to send ☺

By the „Import selected” button you can import the selected programs into the library.

By the „Import all” button you can import tha all program from the „import” table into the library. If you checked the „Exclude same name” boksz, you will not importing the program from the „import” table into the library if library also has a program with the SAME name!

# LiPI's RADIAS Librarian

## The „library” side; the library table

The right side of the librarian is the „library” side with the library table under the randomizer section buttons.

## **LiPI's RADIAS Librarian**

The „Library” field contain the library file name or the „Not saved” if you made any change int he library. The „Programs” field is a counter, it shows how many programs are in the actual library.

By the „RADIAS Currentdump->” button you can get the current RADIAS edit buffer into the library at any time when your MIDI settings are correct and enabled. In thet case your current dump is will the last program in library.

You can select one program by mouse click. In this case the program parameters are send to the RADIAS edit buffer if your MIDI settings are correct and enabled.

If you do multiple selection by CTRL+mouse click or SHIFT+mouse click program parameter does not send to the RADIAS, because the librarian doesn't know which one have to send ☺ In multiple selections you can batch the programmer fileds setting, comment filed setting, the category setting by the „set this text...” text boksz editing and the drop down category menu button by the „selected programmer->” or „selected comment->” or „set this category to the selected->” buttons, or you can export (max of 256 program) to a rdl file by the „Export selected to a rdl file” button or export any to individual rdp files by the „Write selected as individual rdp files” button.

# LiPI's RADIAS Librarian

## The randomizer

The screenshot shows the LiPI's RADIAS Librarian application window. On the left, there is a table of RADIAS presets from a file named 'FactoryTimbres.Part1.rdl'. On the right, there is another table of RADIAS presets from a file named 'AllinOne.rlb'. Between these two tables is a central panel containing various buttons and dropdown menus related to the randomization process.

**Left Panel (FactoryTimbres.Part1.rdl):**

**Central Panel (Buttons and Options):**

- Import selected ->
- Import all ->
- Exclude same name
- RADIAS CurrentDump ->
- set this text to ...
- selected programmer ->
- selected comment ->
- Bass
- set this category to selected ->
- <- selected to a program
- Export selected to a rdl file
- Write selected as individual rdp files

On the top of the right side of the librarian is Randomizer section.

## **LiPI's RADIAS Librarian**

By the first checkbox ayou can set the Noise level always to zero.

The „RND ALL ☺” button is talk the itself I think ☺ It's randomize all of the RADIAS parameters include the pathc assigmentes and intensity too.

The other buttons are also talking for itselvs. The „RES P.” button is resetting the patch assigmentes to the factory preset and the intensitys to zero.

By the „RADIAS Currentdump->” button you can get the randomized (and may tweaked) program into the library. In that case your current dump is will the last program in library.
